

QA ISSUE TRACKER — RememberQuran Mobile App (All Milestones)										
QA Officer: Hafiz Saad Developer: Haseeb Sajjad Project: RememberQuran Mobile App Date: 20/08/2026 Prefix: RQM- (fold into RQ- if preferred) Developer response added: 21/08/2026										
Issue No.	Identified Date	Resolution Date (QA only)	Status	Assigned To	Section/Page	Issue	Detail of the Issue	Required Correction	Response from Developer	QA Notes
RQM-01	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Account System	Notes/Bookmarks Persistence After Logout — Contradictory Findings	Milestone 4 testing found notes do NOT persist after logout. Milestone 6's end-to-end journey, testing the identical scenario, found the opposite.	Re-test this specific scenario directly and confirm definitively which result is accurate before this item is closed either way.	Investigated and fixed. Not a data-loss bug to begin with — notes/bookmarks are Firestore-backed per-account, not device storage; logout only signs out and never deletes cloud data, so logging back into the <i>same</i> account will always correctly show it again. That explains the "contradiction" as two different, both-correct scenarios (checked pre- vs. post-login). Found and fixed one real gap: the bookmarks controller had no auth-state listener (the notes controller did), so if its instance survived a logout it could keep showing stale data until something forced a rebuild. Now mirrors the notes controller's pattern — clears on logout, reloads on login. Please re-test the exact repro: log in, bookmark something, log out, log back into the same account, confirm it's there with no stale/wrong-user data flashing in between.	Direct match to a stated Red Flag. Given the severity, should not be assumed fixed or broken without a clear, deliberate re-test.
RQM-02	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Audio / Navigation	Surah Auto-Advance Shows Error and Skips a Surah	When a surah finishes playing and the app auto-advances, it shows an error and skips a surah entirely (Surah 1 to 3, missing Surah 2).	Fix the auto-advance/surah-transition logic so it moves to the correct next surah without error and without skipping.	Investigated and fixed. A prior infinite-skip-loop bug was already fixed in an earlier commit. Root cause of surahs still being skipped: the playback-completion handler had no guard against firing more than once for the same completion, and the audio engine's event stream can re-fire while still reporting "completed" during the async chapter-load sequence, causing a double-advance that skips a surah. Fixed by reusing a "chapter is loading" flag the app already tracked (previously only used to show a loading spinner) as a guard, so a stale completion event during a load is now ignored. Please re-test: let radio mode auto-advance through several surahs in a row and confirm none are skipped.	
RQM-03	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Navigation	Surah Index Shows Only 8 of 114 Surahs	The surah list/index in the app displays only 8 surahs rather than all 114.	Populate the full 114-surah index with number, Arabic name, English name, and ayah count for each.	Not an actual bug — confirmed all 114 surahs load with no pagination/limit anywhere in the data path. The "8" is a loading-skeleton placeholder count shown only while the real list is loading; likely a screenshot taken mid-load. Please re-test and confirm the full list appears once loading finishes.	
RQM-04	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Navigation	No Way to Jump Directly to a Specific Ayah	There is no ayah-level indexing or search allowing a user to jump directly to a specific ayah (e.g. Surah 2, Ayah 255).	Build ayah-level navigation so users can jump directly to any surah:ayah reference.	Already implemented — the Quick Jump sheet (reader toolbar search icon) accepts a typed surah:ayah reference directly and also offers a tap-through surah→ayah picker. Please re-test and confirm.	
RQM-05	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Navigation	No Previous/Next Surah Buttons	There is no previous/next surah navigation control while reading.	Add previous/next surah buttons to the reading view.	Fixed — added previous/next surah buttons to the reader's toolbar, wrapping around at both ends (surah 114 → 1 and 1 → 114), matching the same convention already used elsewhere in the app. Buttons are disabled while a surah is loading so rapid tapping can't cause overlapping loads. Please re-test: tap through a few surahs in both directions, including the wraparound at the start/end.	
RQM-06	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Audio Controls	Reciter Selection Unavailable in Reading Mode	Reciter selection is not available in the main reading/listening context — it only exists within the separate Quran Radio feature.	Add reciter selection to the reading-mode audio experience, not just Radio.	Fixed — the reciter name in the reading-mode "Now Playing" sheet is now tappable and opens the same reciter picker Quran Radio uses. Switching reciters mid-recitation reloads the current surah with the new reciter's audio and resumes from the same ayah rather than restarting the surah. Please re-test: open Now Playing while a surah is playing, tap the reciter name, pick a different one, and confirm it switches and resumes correctly.	Independently reconfirmed during Milestone 5 testing of additional reciters.
RQM-07	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Audio Controls	Continuous Full-Surah Playback Missing	There is no way to play a full surah continuously, ayah after ayah — only single-ayah playback is available.	Add continuous full-surah playback.	Already true by design — each surah loads as one continuous audio file, so playing any ayah naturally continues through to the end of the surah with no separate logic needed. Please re-test and confirm this matches what was expected when this was filed.	
RQM-08	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Audio Controls	Persistent Mini Audio Player Missing	There is no persistent mini audio player allowing playback to continue while scrolling/reading elsewhere.	Add a persistent mini player that stays visible while audio plays.	Fixed — the mini player widget itself already worked correctly, it just wasn't present on the reading screen (only inside the main tab shell). It's now shown at the bottom of the reader too, so it stays visible while scrolling through a surah. Please re-test: start playback, open a surah, scroll through it, and confirm the mini player stays visible and controllable throughout.	
RQM-09	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Audio Controls	Ayah Repeat (Single + Range) Missing	Neither single-ayah repeat nor custom-range repeat is available.	Add both single-ayah repeat and custom ayah-range repeat with a settable repeat count.	Fixed — the settings UI (mode, count, delay, range) was already correct, but the trigger only fired on whole-surah completion and the restart call was a silent no-op, so repeat never actually looped the intended ayah/range. Both fixed: repeat now triggers right at the target ayah/range boundary during normal playback (using the same live position-tracking already driving word-highlight sync), and restart now correctly seeks back to the ayah's real start time. Please re-test: turn on single-ayah repeat mid-surah and confirm it loops the set number of times with the pause delay honored, then try range repeat.	
RQM-10	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Audio Controls	Playback Speed Control Missing	There is no control to adjust playback speed (e.g. 0.75x, 1.5x).	Add playback speed control.	Already implemented — 0.5x/1x/1.5x/2x control exists and is wired to the real player. 0.75x specifically isn't one of the current steps; happy to add it as a minor enhancement if it's actually needed. Please re-test and confirm.	
RQM-11	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Study Tools	Tafsir Missing Entirely	No tafsir is available anywhere in the app — neither the base Ibn Kathir tafsir nor the additional tafsir books expected from Milestone 5.	Implement tafsir display per ayah, matching the web platform's tafsir functionality.	Already implemented — all 5 tafsir books are fully wired (same backend the web app uses), with book selection and loading/error/empty states, reachable from every ayah. Please re-test; if it was genuinely absent during testing, worth checking which build/version was in use, since the current code has it complete.	Independently confirmed across three separate test sections (Milestones 3, 5, and the Milestone 6 end-to-end journey).
RQM-12	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Study Tools	Word Morphology/Grammar Panel Missing	There is no way to view a word's root and grammatical form.	Implement the word morphology/grammar panel present on web.	Fixed — the word-detail sheet now shows Part of Speech, Lemma, Root, and Grammar (humanized, e.g. "Masculine Singular" rather than raw codes) beneath the translation, using data already bundled with the app. Verified the underlying data lookup directly against the real asset file (word 1:1 correctly resolves to Noun / root نَصْر, matching known Arabic grammar). Please re-test in the app: tap an Arabic word and confirm the grammar panel appears.	
RQM-13	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Study Tools	Reasons for Revelation Missing	No reason-for-revelation information is available for any tested ayah.	Implement reasons-for-revelation content where available, matching web.	Already implemented, same pattern as tafsir — fully wired with a bundled coverage check plus live data fetch, reachable from every ayah. Please re-test and confirm.	
RQM-14	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Account System	Password Reset Email Not Arriving	Using "Forgot password" does not result in a reset email arriving.	Fix password-reset email delivery.	Code path is correct — calls Firebase Auth's real password-reset API directly with proper error handling; this isn't a wiring bug, and confirmed the app is registered against the same Firebase project as the web app, so it's not a wrong-project misconfiguration either. Fixed the one real code gap: non-Firebase errors (e.g. no network) previously failed silently with no feedback; now shown to the user. Also reworded the success message, which previously stated "we've sent instructions" as unconditional fact — Firebase's enumeration protection makes this call succeed even when no account exists for that email, so the app can't actually confirm that, and the old wording risked being read as a false claim. Now says "if an account exists, we've sent..." plus a spam/junk-folder nudge, which also covers the other realistic explanation for "never arrived": a genuine send filtered as spam. Every part of this fixable by editing the app is done. The remaining piece — if a real account genuinely never receives the email — is a one-time Firebase Console check only the project owner can do (Authentication > Templates: password reset enabled, sender domain/SPF/DKIM verified) and isn't something achievable from a code change. Please check there and confirm the test email actually has an account before re-testing.	Please have the project owner check the Firebase Console items noted above — that's the only remaining step to fully close this out.

Issue No.	Identified Date	Resolution Date (QA only)	Status	Assigned To	Section/Page	Issue	Detail of the Issue	Required Correction	Response from Developer	QA Notes
RQM-15	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Account System	Bookmark Collection Assignment Not Available While Saving	There is no option to select which collection a bookmark should be saved into at the time of saving — all bookmarks default into the first collection.	Add collection selection to the bookmark-saving flow, and ensure bookmarks are correctly organised by collection on the bookmarks page.	Fixed — bookmarking a new ayah now opens a picker listing your collections (with counts, Favourites starred), or you can type a name to create and save into a new one on the spot. Removing an existing bookmark stays a single fast tap, unchanged. The bookmarks page already correctly organised bookmarks per collection; it just never had anything to show there before since everything went to Favourites. Please re-test: bookmark something into a non-Favourites collection and confirm it shows up correctly on the bookmarks page.	
RQM-16	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Account System	Clicking a Bookmark Doesn't Open the Ayah	Clicking a saved bookmark does not navigate to the corresponding ayah.	Fix bookmark click-through so it correctly opens the associated ayah.	Fixed — the bookmark tap handler was a literal no-op referencing a route that no longer exists; now uses the same navigation pattern search results already rely on to jump to a specific ayah. Also fixed the identical gap on the Notes tab (tapping a note did nothing at all) while in there, since it's the same bug. Please re-test: tap a bookmark and a note and confirm both open the correct ayah.	
RQM-17	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Account System	Reading Streak Doesn't Update	After completing the reading task needed to progress a streak, the streak is not updated in the app.	Fix streak-tracking logic so completed reading activity correctly updates the visible streak.	Investigated and fixed. The streak pipeline itself was already wired correctly end-to-end, not a stub — the real bug was a timing race: the reader's final save of your reading progress fires right as you navigate away, but wasn't guaranteed to finish before you could reach the Goals screen, so it could show a snapshot from just before your session. Fixed by making the app wait for that save to complete before leaving the reader. Please re-test: with a goal set, read enough to meet it, back out straight to Goals, and confirm it reflects the session immediately. (Two smaller, separate things noted for later if this doesn't fully resolve it: the streak only starts once a goal is actively set, and Goals doesn't live-update if you stay on that screen without navigating.)	
RQM-18	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Media Maker	Missing Branding and No Download Option	The generated shareable ayah image does not include RememberQuran.com branding, and there is no option to download the image directly — only a share button is available.	Add the RememberQuran logo/branding to generated images, and add a direct download option alongside share.	Fixed — the RememberQuran.com branding (icon + name) is now baked directly into the generated card image itself, not just the share caption, so it survives being saved or re-shared on its own. Added a Save-to-Gallery option (AppBar icon and a bottom button alongside Share) using the device's native photo permissions. Please re-test: design a card, tap Save, grant the photo permission prompt if shown, and confirm the saved image includes the branding footer.	Also less accessible than on web (reachable directly from the reading page there) — a UX convenience note, not a functional defect.
RQM-19	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Memorisation Tools	Largely Unimplemented	Several memorisation-mode capabilities are missing: range selection for hide/reveal, a settable repeat count for a memorisation range, and a memorised-ayah progress tracker. Basic single-ayah reveal does work correctly.	Implement range selection for hide/reveal, range-repeat for memorisation, and the memorised-ayah tracker.	Fixed — single-ayah reveal was already correct as reported, unchanged. Added a from/to ayah range picker to the reader settings sheet (only shown while Hifz Mode is on); ayahs outside the chosen range now stay visible while ones inside still hide/reveal per-tap as before. Added a "Mark as Memorised" button to each ayah in the reader, wired to the progress tracker's existing (but previously never-called) storage layer — the tracker itself was already fully built (storage, per-surah/per-juz calculations, and the full progress screen), it just had nothing anywhere feeding it, so it always showed 0%. On investigation, range-repeat turned out to already be fully implemented and working (a real repeat-range engine wired to a working start/end ayah picker in the Now Playing sheet) — that part of the original report was inaccurate, not a missing feature. Please re-test: mark an ayah as memorised and check it appears reflected on the Hifz Progress screen; set a hifz range and confirm ayahs outside it stay visible.
