

Regression Checklist — Flutter Mobile App

Run through these tests on a physical iOS device and a physical Android device before signing off each phase of the `rememberquran` Flutter port. Mirrors the web app's M1–M5 groupings so platform parity is easy to audit; M6 covers mobile-only concerns the web checklist has no equivalent for.

iOS (physical device)

Android (physical, mid-tier)

Guest + signed-in

Online + Airplane Mode

M1: Core Reading Experience

- ✓ Verify all 114 surahs load correctly while online.
- ✓ A surah already opened once while online is readable again in Airplane Mode (per-chapter cache in the local drift/SQLite store). The full Qur'an text also pre-seeds itself in the background on first launch, so surahs work offline even without being opened first — a slow or offline first launch just falls back to the per-chapter cache until seeding succeeds. **UPDATED**
- ✓ Arabic text renders in Uthmani script with diacritics using the bundled KFGQPC Uthmanic Hafs font (not a system fallback).
- ✓ Tap on an Arabic word opens the meaning/transliteration bottom sheet (no hover state on mobile).
- ✓ Multi-select translations work correctly — up to 3 active at once from the full 10-translation set, plus an "Arabic only" option; Saheeh Intl. and Clear Quran remain the defaults. **UPDATED**
- ✓ Switching between verse-by-verse and continuous reading modes works.
- ✓ Reader text size adjustment works and persists via `shared_preferences`.
- ✓ Arabic font family (Hafs / Amiri / Amiri Quran) is switchable in Reader Settings and persists. **NEW**
- ✓ Theme follows System by default; manual Light/Dark override in Reader Settings works and persists. **UPDATED**
- ✓ Deep link to a specific ayah (Universal Links on iOS, App Links on Android) opens the app directly — not the browser — and scrolls to the correct verse, both cold-start and warm-start.
- ✓ Copy ayah and native Share sheet (`share_plus`) work.

M2: Audio & Recitation

- ✓ Audio plays correctly for all 20 reciters (id 8, Al-Minshawi Mujawwad, excluded — matches the web registry pending the upstream QDC fix).
- ✓ Persistent mini player stays mounted across screen navigation, not scoped to a single tab.
- ✓ Background playback continues when the app is backgrounded; lock-screen / notification-shade media controls (play, pause, skip) work.
- ✓ Playback correctly pauses/resumes across a phone call interruption and a Bluetooth device switch mid-playback.
- ✓ Tap-to-hear individual word pronunciation works (via the word-meaning sheet's play button).
- ✓ Word-by-word highlight syncs with audio playback, for reciters with word-timing data; a per-ayah "play from here" control starts playback at that verse. Downloaded-for-offline audio still plays with Airplane Mode on, but won't highlight if timing data wasn't cached while online.
NEW
- ✓ Downloading a surah's audio for offline listening (per reciter) works from the Radio screen; downloaded audio plays back correctly with Airplane Mode on. NEW
- ✓ Repeat ayah/range works; manually navigating during an active repeat cancels it instead of snapping back.
- ✓ During a repeat's pause gap, manually toggling play/pause or scrubbing doesn't leave a stray timer that yanks playback backward later.
- ✓ Playback speed control works via `just_audio`'s native speed API.
- ✓ Quran Radio (`/radio`) plays continuously and wraps from surah 114 back to 1.

M3: Study Tools

- ✓ Tafsir panel loads and displays content for all 5 books.
- ✓ Tajweed colour coding toggles correctly on Arabic text.
- ✓ Keyword search returns accurate Arabic/English results.
- ✓ Word morphology (root, lemma, grammatical form) displays correctly on tap, from the bundled per-surah dataset — no raw untranslated feature codes leaking through.
- ✓ Asbab al-Nuzul (reasons for revelation) displays where available; the "available" indicator doesn't require a network round-trip to decide whether to show itself.

M4: Accounts & Personal Features

- ✓ Register / Login / Logout work via native Firebase Auth email/password flow.
- ✓ Password reset works via Firebase Auth's built-in reset email.
- ✓ Change email / change password work via a native re-authenticate-then-update flow.
- ✓ Adding/removing bookmarks and collections works; concurrent deletes can't orphan a bookmark against its collection.
- ✓ Adding/editing/deleting private per-ayah notes works, including at the per-user count limit (transactional, no race).
- ✓ "Continue where you left off" prompt redirects to the correct saved position.
- ✓ Reading progress, daily goals, and streaks update correctly using the device's local timezone; non-contiguous reading doesn't inflate the daily count.
- ✓ Media Maker generates and exports an ayah image card, then hands off to the native share sheet.
- ✓ Reading, audio, and study features all work for logged-out (guest) users — no account screen gates a content path by mistake.
- ✓ Full account lifecycle — register, use every account feature, change password, delete account — leaves no orphaned Firestore data.

M5: Expansion

- ✓ All 10 translations load correctly via the reader settings multi-select (see M1), along with the "Arabic only" option. **UPDATED**
- ✓ All 5 tafsir books load correctly.
- ✓ "Hide Arabic" memorisation mode toggles correctly per ayah and resets when the surah changes.
- ✓ Hifz progress tracker updates correctly by surah and by juz (/account/hifz), including at the per-user count limit.
- ✓ Range repeat includes a pause between repetitions for memorisation drilling.

M6: Store Readiness & Mobile-Specific QA

- ✓ Cold-start time is acceptable on a mid-tier Android device, not just a current-gen iPhone.
- ✓ Reader and search lists scroll without jank on a mid-tier Android device.

- ✓ Audio-start latency is acceptable.
- ✓ iOS Universal Links (`applinks:remember-quran-com.vercel.app`) open the app directly, never Safari.
- ✓ Android App Links (autoVerify intent filter on `remember-quran-com.vercel.app`) open the app directly, never the browser.
- ✓ No unnecessary permission prompts (microphone, storage) appear for features that don't need them.
- ✓ Crash reporting (Firebase Crashlytics) is wired up and reporting; disabled in debug builds so local dev doesn't pollute the dashboard. **NEW**
- ✓ Daily reading reminder (local notification) can be enabled in Settings, correctly requests OS notification permission, and its copy reflects the user's actual current streak. **NEW**
- ✓ App Store Connect listing is complete: screenshots and privacy nutrition labels.
- ✓ Play Console listing is complete: Play Data Safety form matches actual data use.
- ✓ Full regression pass across M1–M5 completed on both a physical iOS device and a physical Android device.
