

RememberQuran QA Checklist

Manual regression checklist for release builds

App: RememberQuran (Flutter, Android & iOS) **Version under test:** 1.0.0+1 **Document date:** 2026-09-04 **Build artifact:** release/RememberQuran-release.apk

1. Purpose & Scope

This checklist is for a human tester to manually exercise every major feature of the RememberQuran mobile app before a release is signed off. It doubles as a lightweight user manual — each section explains what the feature is supposed to do before listing what to verify.

Test on at least:

Axis	Minimum coverage
OS	1 Android device/emulator (API 30+) and 1 iOS device/simulator (iOS 15+)
Screen size	1 phone, 1 tablet (or a resized emulator window)
Network	Online (Wi-Fi), online (cellular/throttled), fully offline (airplane mode)
Theme	Light mode, dark mode, system-default
Account state	Signed out, signed in

Mark each row **Pass** / **Fail** / **Blocked** and attach a screenshot for any Fail.

2. Pre-Test Setup

- ☐ Fresh install (uninstall any previous build first — do **not** upgrade over an old install for the first pass, to catch migration bugs from a clean DB).
- ☐ Grant/deny permission prompts as they appear (notifications, storage) and confirm the app doesn't crash either way.
- ☐ First launch is on Wi-Fi — confirm the splash screen (“Alhamdulillah, ready to begin.”) completes and chapters populate.
- ☐ Second pass: install as an **upgrade** over the previous release build (not a clean install) to catch database migration issues.

3. Onboarding & Splash

- ☐ Splash screen shows the app icon, name, and a progress indicator; no flash of blank/white screen.
- ☐ Onboarding carousel (first-run only) swipes through all slides; **Skip** jumps straight to Home.
- ☐ Onboarding does not reappear on subsequent launches.

4. Home Screen

- ☐ **Ayah of the Day** card renders Arabic text, translation, and reference correctly — no oversized/misshapen glyphs where a small diacritic mark (e.g. the silent-alif) appears mid-word.
- ☐ **Read in context** opens the reader scrolled/paged to that exact ayah.
- ☐ **Make a card** opens the Ayah Card Designer pre-filled with that ayah.
- ☐ **Search the Quran** bar opens Search.
- ☐ **Start reading** resumes the last-read position (signed-in users) or opens Al-Fatihah (first-time/signed-out).
- ☐ Directory list shows all 114 surahs with number, name (English + Arabic), revelation place, and verse count.
- ☐ **All / Makki / Madani** filter chips correctly filter the directory list.
- ☐ Tapping a surah row opens the Reader on that surah.
- ☐ Settings gear icon opens Account/Settings.
- ☐ Bottom nav (Home / Radio / Search / Account) switches tabs without losing Home's scroll position.

5. Reader — General

The Reader has three display modes, switchable in Reader Settings: **Verse-by-Verse**, **Continuous**, and **Mushaf**.

- ☐ App bar shows the correct surah name, updates live as you navigate.
- ☐ < > prev/next-surah arrows move exactly one surah per tap; rapidly tapping several times in a row never leaves the header showing one surah while the body shows another (header and displayed ayahs must always match).
- ☐ Prev/next arrows are disabled (greyed out) while a surah is loading, and re-enable promptly once it finishes — they must never stay stuck disabled.
- ☐ Back arrow returns to the previous screen promptly, even on a slow/offline connection (must not hang).
- ☐ Juz/Hizb navigation icon opens a sheet to jump to any Juz or Hizb.
- ☐ Quick Jump (search icon in reader) jumps to any surah:ayah.
- ☐ Reader remembers your last-read position across app restarts (signed-in users).
- ☐ “Resumed from Ayah N” banner appears when applicable and is dismissible.

5a. Verse-by-Verse mode

- ☐ Each ayah is its own block: ayah-number badge, Arabic text, translation(s) beneath.

- ☐ Per-ayah toolbar icons all work: Play (audio), Share, Make-a-card, Copy, Bookmark, Study (tafsir/word).
- ☐ Long surahs scroll smoothly (no jank/frame drops) with `ScrollablePositionedList`.

5b. Continuous mode

- ☐ Ayahs flow as one continuous paragraph per surah (no per-ayah card chrome).
- ☐ Ayah numbers/markers are still visible inline.

5c. Mushaf mode (Madani 15-line standard) — priority for this release

This mode reproduces the physical King Fahd Complex Madani mushaf: 15 lines per page, justified edge-to-edge, with surah cartouches and Bismillah headers where a surah begins.

- ☐ Opening a surah lands on the correct physical page (matches a printed Madani mushaf, e.g. Al-Baqarah starts on page 2).
- ☐ Al-Fatihah and the start of Al-Baqarah (pages 1–2) render as **centered calligraphic flow**, not the standard justified grid.
- ☐ All other pages render as a **15-line justified grid** — no page should show only a handful of lines with a large blank gap at the bottom.
- ☐ **Continuous cross-surah flow**: when a surah is short enough (or a page falls mid-surah), the page must show the *previous* surah's trailing verses **and/or** the *next* surah's opening verses on the same physical page, exactly as a printed mushaf does. Test explicitly on a surah-boundary page, e.g.:
 - Open **Al-Ma'idah**, go to its **first page** (page 106) — it must show An-Nisa's final ayah (4:176) at the top, *then* the Al-Ma'idah surah cartouche, Bismillah, and ayah 1 onward, all on one page.
 - Open a surah's **last page** and confirm the *next* surah's cartouche/opening lines appear if the printed mushaf places them on the same page.
- ☐ The page header (Juz / Surah name / Page number) names whichever surah **opens** that physical page — not necessarily the surah you navigated from, on a shared boundary page.
- ☐ No line of text is ever clipped or overflows past the page's right/left edge (watch for Flutter's yellow/black "overflow" warning stripes) — check a long-ayah page such as **Ali 'Imran page 50** and a dense page such as **An-Nisa page 77**.
- ☐ Ayah-end markers render as the small ornate medallion glyph with the correct Arabic-Indic ayah number — never as an oversized plain circle.
- ☐ Swiping / using the < page-indicator arrows moves one physical page at a time; the "Page N (X of Y)" footer always matches what's on screen.
- ☐ Tapping a word opens its meaning sheet; the active word during audio playback is highlighted correctly even mid-page.
- ☐ Switching **Mushaf** → **Verse-by-Verse** → **Mushaf** (via Settings) preserves your reading position reasonably.

6. Reader Settings

- ☐ Font picker (UthmanicHafs / Amiri / etc.) changes the Arabic script rendering everywhere in the reader.
 - ☐ Font size slider changes Arabic text size live, without breaking the Mushaf page's line-fitting (still no overflow at the largest size).
 - ☐ Display mode segmented control switches between Verse-by-Verse / Continuous / Mushaf and persists after app restart.
 - ☐ Translation picker: toggling "Arabic only" hides all translations; selecting up to the max simultaneous translations works; deselecting the last one falls back to Arabic-only.
 - ☐ Tajweed color-coding toggle recolors letters per tajweed rule (madd, ghunnah, qalqalah, etc.) without altering the underlying text.
 - ☐ Theme (Light/Dark/System) applies instantly across every screen, not just the reader.
-

7. Hifz (Memorisation) Mode

- ☐ Enabling Hifz mode blurs/hides Arabic text for ayahs in the active range.
 - ☐ Tapping a hidden ayah reveals it; a re-hide control appears once revealed.
 - ☐ Setting a custom ayah range restricts hiding to that range only; ayahs outside it render normally.
 - ☐ "Mark as memorised" / bulk range-mark works and updates the Hifz progress screen.
 - ☐ Hifz progress screen (Account → Hifz) shows accurate per-surah/per-juz percentages.
 - ☐ Hifz review flow (spaced repetition) presents due ayahs correctly.
 - ☐ Hitting the memorisation limit shows a clear "limit reached" message rather than failing silently.
-

8. Word-Level Interactions

- ☐ Tapping any Arabic word opens a sheet with its translation, transliteration, and (where available) morphology.
 - ☐ Word audio (if present) plays the correct word-level recitation.
 - ☐ The currently-playing word highlights in sync with audio, in all three reader display modes.
-

9. Ayah-Level Actions

- ☐ **Play:** starts recitation from that ayah; mini-player appears/updates.
- ☐ **Share:** opens the native share sheet with correct ayah text + reference.
- ☐ **Make a card:** opens Ayah Card Designer pre-filled with that ayah.
- ☐ **Copy:** copies Arabic (+ translation if enabled) to clipboard.
- ☐ **Bookmark:** toggles on/off; icon state reflects current status immediately; failure (e.g. offline, signed-out) shows an error and rolls the icon back rather than lying about the saved state.
- ☐ **Study** (lightbulb icon): opens Tafsir / Asbab al-Nuzul / word-detail sheets with real content, not placeholders.

10. Bookmarks & Collections

- ☐ Bookmarks list (Account → Bookmarks) shows every saved ayah, grouped by collection.
 - ☐ Creating a new collection, renaming, and deleting all work.
 - ☐ Moving a bookmark between collections works.
 - ☐ Removing a bookmark from the list also un-bookmarks it in the reader.
-

11. Notes

- ☐ Adding a note to an ayah saves and displays correctly.
 - ☐ Editing and deleting notes both work.
 - ☐ Notes list (Account → Notes) shows all notes with correct ayah references.
-

12. Goals & Progress

- ☐ Setting a daily/weekly reading goal saves correctly.
 - ☐ Reading activity (dwelling on ayahs while scrolling) is recorded and reflected in the Progress screen after a short delay — check this doesn't fire multiple duplicate events when rapidly navigating.
 - ☐ Progress charts/streaks update after a real reading session.
-

13. Search

- ☐ Searching Arabic text, transliteration, and English keywords all return relevant results.
 - ☐ Tapping a result opens the reader at that exact ayah.
 - ☐ Empty/no-match query shows a clear empty state, not a crash.
 - ☐ **Known issue to verify is fixed or explicitly triaged:** opening Search must not throw a "SearchController" not found error — if it does, log it as a blocking bug (missing GetX controller registration), independent of the reader work in this release.
-

14. Radio / Audio Playback

- ☐ Radio tab lists reciters/streams and starts playback.
- ☐ Mini-player appears app-wide once audio starts and persists across tab/screen navigation (including inside the Reader).
- ☐ Full-screen player shows correct art, reciter, surah/ayah, and transport controls (play/pause/skip/seek).

- ☐ Background playback continues when the app is backgrounded/screen is locked (Android 13+ notification permission flow, iOS background audio).
 - ☐ Downloading a surah's audio for offline playback works and plays back with no network.
 - ☐ Switching reciters mid-playback works without audio glitches or crashes.
-

15. Ayah Card Designer (Media Maker)

- ☐ Opening from Home's "Make a card", or an ayah's toolbar, pre-fills the correct ayah.
 - ☐ Background/theme options apply live to the preview.
 - ☐ Exporting/sharing the generated image produces a correctly rendered card (no clipped Arabic text, no missing translation).
 - ☐ Video export (if applicable) produces audio that plays back correctly (this app has had prior audio-export bugs — retest explicitly).
-

16. Study Panel (Tafsir / Asbab al-Nuzul / Word Detail)

- ☐ Tafsir view lists available tafsir books; selecting one loads real commentary text for the current ayah.
 - ☐ Switching tafsir books updates content without a stale/blank flash.
 - ☐ Asbab al-Nuzul (reasons for revelation) loads content where available, and shows a sensible empty state where it isn't.
 - ☐ Word-detail view shows root, morphology, and grammatical notes accurately.
-

17. Account & Auth

- ☐ Register with email/password creates an account and lands on Home signed in.
 - ☐ Login with valid credentials succeeds; invalid credentials show a clear error.
 - ☐ Reset-password flow sends/handles the reset correctly.
 - ☐ Sign out clears session state; bookmarks/notes/goals screens correctly prompt sign-in afterward instead of showing stale data.
 - ☐ Using the app fully signed-out never crashes — bookmark/hifz/goal actions should prompt sign-in rather than fail silently.
-

18. Notifications

- ☐ Notification permission prompt appears at an appropriate time (not immediately on first launch, ideally).
- ☐ Scheduled reminder notifications (if configured) fire at the expected time and deep-link into the correct screen when tapped.

19. Navigation & App Shell

- ☐ Bottom navigation preserves each tab's own scroll/state when switching away and back.
 - ☐ Deep links (e.g. shared ayah links) open directly to the correct surah/ayah.
 - ☐ Android hardware/gesture back button behaves correctly on every screen (no dead-ends, no double-pop, no accidental app exit from a nested screen).
 - ☐ Rotating the device (if orientation isn't locked) doesn't lose reader position or crash.
-

20. Offline Behaviour

- ☐ With the Quran text already seeded once, enable airplane mode and confirm: browsing surahs, reading in all 3 display modes, bookmarking (should queue/prompt appropriately), and search over already-cached text all still work.
 - ☐ Actions that genuinely require network (audio streaming not yet downloaded, sign-in, posting a new bookmark to the server) fail gracefully with a clear message — no indefinite spinners, no crash.
 - ☐ Reconnecting shows the "You're back — the surah loaded fine" (or equivalent) recovery messaging where applicable.
-

21. Performance & Stability

- ☐ Cold start time is reasonable (note the actual seconds on your test device).
 - ☐ Scrolling long surahs (e.g. Al-Baqarah) in all 3 reader modes stays smooth — no dropped-frame stutter.
 - ☐ Rapidly switching surahs back-to-back (stress test — tap next/prev as fast as possible for 10+ taps) never desyncs the header from the content, and never leaves the UI stuck/unresponsive.
 - ☐ No memory growth/crash after 10+ minutes of continuous navigation + audio playback.
 - ☐ Check device logs (`adb logcat` / Xcode console) for any uncaught exceptions during the full pass, even ones that don't visibly break the UI.
-

22. Accessibility

- ☐ Increasing system font size doesn't break layout (text overlapping icons, clipped buttons).
 - ☐ Sufficient color contrast in both light and dark themes for body text and toolbar icons.
 - ☐ Screen reader (TalkBack/VoiceOver) can reach and announce primary navigation elements.
-

23. This Release's Fix Verification (Regression Focus)

These are specific, previously-broken behaviours that must be explicitly re-verified before sign-off:

- ☐ **Silent-alif glyph:** the Home screen's Ayah of the Day (and anywhere else Arabic verse text renders) never shows an oversized plain circle where a small raised diacritic mark belongs.
- ☐ **Navigation desync:** rapidly tapping next/prev surah in the Reader never results in the app-bar surah name mismatching the ayahs actually displayed.
- ☐ **Stuck nav buttons:** next/prev/back controls never remain permanently disabled/unresponsive after navigation, even on a slow connection.
- ☐ **Mushaf line overflow:** no page in Mushaf mode shows clipped/overflowing text on any surah, including ones with long ayahs (Ali 'Imran, An-Nisa, Al-Ma'idah early pages).
- ☐ **Mushaf continuous flow:** boundary pages between two surahs render both surahs' content on the same page, matching the physical mushaf, with the correct surah credited in the page header.

24. Bug Report Template

For any Fail above, capture:
