

QA ISSUE TRACKER — RememberQuran (Milestone 6: Final Polish & Full Sign-Off)										
QA Officer: Hafiz Saad Developer: Haseeb Sajjad Project: RememberQuran.com — Milestone 6 Date: 20/08/2026 Developer response added: 21/08/2026										
Issue No.	Identified Date	Resolution Date (QA only)	Status	Assigned To	Section/Page	Issue	Detail of the Issue	Required Correction	Response from Developer	QA Notes
RQ-03	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Account System	Registration & Login Both Broken	New user registration does not work at all. Attempting to log in fails with a raw server error displayed directly to the user: "This page isn't working — remember-quran-com.vercel.app is currently unable to handle this request. HTTP ERROR 500."	Fix both the registration flow and the login endpoint (currently returning HTTP 500). Ensure no raw technical/server error is ever shown to end users.	Fixed — verified live in production (21/08/2026). Root cause was not missing credentials but two unrelated bugs: (1) a stale uuid dependency override had drifted to an ESM-only version, which crashed firebase-admin on every request (require() of ES Module); (2) the local .env file was being uploaded with the deploy and silently pointed production at a local Firestore-emulator address instead of the real database. Fixed both, and hardened the login callback so any future backend failure returns a normal "invalid credentials" response instead of a raw error page. Confirmed against the live site: registration returns 201 with a real user record, login completes normally, and /api/health reports the database connected.	Direct match to a stated Red Flag. Also blocks testing of bookmarking, notes, reading goals, logged-in image sharing, and bookmark/note persistence — none confirmed as separate bugs until login is fixed and re-tested.
RQ-04	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Audio Playback	Doesn't Update When Switching Surahs	When navigating from one surah to another, the audio does not update to match the newly selected surah. General functional issue, not browser-specific.	Ensure audio playback state correctly resets and updates to the newly selected surah when navigating away mid-playback.	Fixed — verified live in production (21/08/2026). Root cause: switching surahs while one was still playing could fire a stray native "pause" event as the audio source was reassigned, which clobbered the loading state and left the player stuck showing "paused" instead of the new surah. Fixed and confirmed with an automated repro against the live site: played Surah 1, navigated to Surah 2, pressed play again — audio correctly switched to Surah 2's file within ~1 second, the player showed "playing," and the now-playing label advanced normally (Al-Baqarah 2:1 → 2:2). No stuck-paused state and no cross-surah audio observed.	Relates to the brief's stated Red Flag on audio belonging to the wrong surah/ayah.
RQ-05	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Tafsir	Quoted Arabic Ayaat Not in Proper Arabic Font	Quranic ayaat quoted within tafsir text are not displayed using the proper Arabic font used elsewhere on the platform.	Apply the same Arabic font/typeface used for the main ayah display to any quoted Quranic text within tafsir content.	Fixed — deployed to production. The tafsir HTML sanitizer was stripping the direction/language markup off quoted ayaat, and the tafsir panel's font stack didn't route through the reader's selected Arabic font (it always fell back to the default typeface). Both corrected: quoted ayaat now render right-to-left in the same font used elsewhere in the reader, including when the reader's font preference is changed.	
RQ-06	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Reading Mode	Formatting Weaker Than Comparable Sites	Formatting is not as polished as comparable Quran platforms when reading mode is selected.	Review reading-mode formatting/typography against comparable platforms and improve as needed.	Fixed — deployed to production. Reading mode had no structural markers and put translation in one long block disconnected from the Arabic; addressed both. (1) Added a centered "Juz n" divider wherever the juz number changes, including at the start of the surah — verified live: Al-Baqarah correctly shows "Juz 1," "Juz 2," "Juz 3" at the exact canonical boundaries. (2) Each ayah's translation now follows immediately after its own Arabic instead of appearing in one block at the end of the surah, kept deliberately free of the per-ayah controls verse-by-verse mode has so Reading mode still reads as one continuous pass — verified live on Al-Fatihah, every ayah correctly paired with its translation and attribution in order. Please re-test and confirm this addresses the feedback, or clarify if something else was meant (e.g. line spacing, font choice).	Worth clarifying whether this is about correctness/readability or purely visual polish.
RQ-07	20/08/2026		Fixed – Pending QA Verification	Haseeb Sajjad	Card Creation	Text Not Center-Aligned	Text within created shareable ayah-image cards is not center-aligned. General issue, not browser-specific.	Center-align text within the card-creation output.	Fixed — deployed to production. Both the Arabic ayah text and the translation text in the shareable card were right/left-aligned by default; both are now center-aligned. The surah name / verse reference / watermark footer row was left as-is (attribution on one side, branding on the other) since that split layout reads as an intentional design choice rather than the same bug — flag separately if that should also change.	
RQ-08	20/08/2026		Needs Clarification	Haseeb Sajjad	Final Sign-Off Checklist	Multiple Checklist Items Not Yet Completed	Several rows on the Final Sign-Off Checklist remain blank/unverified: Safari or Edge compatibility, all five previous-milestone regression checks (Milestones 1–5), the no-ads/pop-ups/broken-pages check, and the branding-consistency check.	Not a fix — complete testing on these remaining checklist items before this milestone can be considered for full sign-off.	Not a code fix — this is a testing/QA task, left as-is for QA to run. Note for context: the account-system bug (RQ-03) that was blocking most of Milestone 4 testing (bookmarking, notes, goals, logged-in image sharing) is now fixed in production, so those areas and the Milestones 1–5 regression pass should be re-testable now. Recommend running the Safari/Edge and M1–5 regression checks against the live production site.	The brief flags previous-milestone regressions as a Red Flag category — worth a deliberate pass on Milestones 1–5 before treating this checklist as complete.
