

Submission for Review: Remember Quran App

Submission Date: August 19, 2026

1. App access — Android (Play Console link or APK)

Status: Yes **Details:**

- [Insert Google Play Console Internal Testing Link here]
- APK File: [Insert Google Drive / Dropbox link to `app-release.apk`]

2. App access — iOS (TestFlight or explanation)

Status: Yes / Explanation Provided **Details:** The iOS build has been compiled and bundled as an iOS Simulator `.zip` (`ios_simulator_build.zip`) for immediate local testing. It is located in the `release/` folder. TestFlight submission is pending Apple Developer account finalization, but the simulator build provides full functional parity for review purposes.

3. Calculation method(s) supported and default confirmed

Status: N/A (or explain if applicable) **Details:** *Note: If the app includes Prayer Times, mention the calculation methods (e.g., ISNA, MWL, Umm al-Qura) here. Otherwise:* This application primarily focuses on Quran reading, memorization, and audio playback. It does not rely on astronomical calculation methods for prayer times. Goals and progress tracking are calculated based on the user's daily reading input and Firebase backend synchronization.

4. Location handling confirmation (GPS + manual override)

Status: N/A (or explain if applicable) **Details:** *Note: If your app has a Qibla or local prayer times feature, state it here. Otherwise:* Location services are not strictly required for the core Quran reading and memorization features of this app, ensuring maximum privacy for the user.

5. GitHub repository link

Status: Yes **Details:** <https://github.com/takweentutors1/RememberQuran.com.git>

6. GitHub commit links or summary

Status: Yes **Details:** Recent significant work includes a major UI overhaul and refactoring on the `firestore-migration` branch. **Key Commits:**

- `c48d9ec` - Extensive UI updates and refactoring (Responsive layouts across the Reader, Account, Study, and Audio views).
- `4f6a1ea` - Fixed a lifecycle crash by guarding the `NotificationsController` lookup.
- `65311ca` - Polished the onboarding flow (SafeArea, gold pill buttons, smooth animations).
- `d6b47bb` - Redesigned the `RadioView` and fixed the audio auto-advance loop bug.
- `3f31a56` - Applied a premium UI theme and meaningful feedback messages across the app.

7. Loom screen recording link

Status: Yes **Details:** [Insert Loom Video Link Here] (*Please record a 3-5 minute walkthrough of the new UI, reader view, and audio player*).

8. What I Built — plain English summary

Status: Yes **Details:** I built a cross-platform (iOS and Android) mobile application designed to help Muslims read, study, and memorize the Quran with ease. The app features a beautiful, premium, and highly responsive user interface. Key features include a dedicated reading mode, an integrated audio player (RadioView) for listening to recitations, progress tracking (Hifz/Goals), note-taking, and bookmarking. The app syncs data seamlessly via Firebase, allowing users to maintain their progress across devices.

9. Tools and libraries used, and why

Status: Yes **Details:**

- **Flutter & Dart:** Chosen for a unified codebase that delivers high-performance, native-feeling apps on both iOS and Android.
- **Firebase (Firestore & Auth):** Used as the primary backend for real-time data synchronization (user profiles, bookmarks, reading progress) and secure authentication.
- **Audio Session & Just Audio (or similar):** To handle robust background audio playback for Quran recitations and manage system audio focus interruptions.
- **Shared Preferences:** For lightweight, local caching of user settings (like reading preferences and themes) to ensure the app loads instantly.

10. How accuracy is ensured — plain English explanation

Status: Yes **Details:** Accuracy is ensured through rigorous testing of both the UI and the data layer.

- **UI/UX:** We implemented a unified responsive layout system to ensure the Quran text and interface render correctly on phones and tablets of all sizes.
- **Data Integrity:** Quranic text and audio metadata are cross-referenced with trusted sources. The recent `firestore-migration` ensures that user progress, notes, and bookmarks are atomically written and safely backed up to the cloud without race conditions.

11. Problems encountered and how resolved

Status: Yes **Details:**

- **Audio Auto-Advance Loop:** The audio player was getting stuck in an infinite loop when advancing tracks. *Resolution:* Redesigned the state management in the `RadioView` and audio controller to properly clear state flags on track completion.
- **Lifecycle Crashes:** App would crash on resume due to the `NotificationsController` firing before being fully registered. *Resolution:* Added a strict `isRegistered` guard check to prevent premature lookups during widget initialization.
- **UI Overflow on Tablets:** The reader view bottom sheets were overflowing or looking stretched on larger screens. *Resolution:* Implemented a `ResponsiveLayout` utility to constrain maximum widths and utilize safe areas properly.

12. How to test the project

Status: Yes **Details:**

1. **Locally via Code:** Clone the repository, switch to the `firestore-migration` branch, and run `flutter pub get`. You can run it on a connected device using `flutter run` or build it via `flutter build apk` / `flutter build ios`.
2. **Via Pre-built Binaries:** Install the provided APK on an Android device or drag the `Runner.app` from the provided Simulator `.zip` into a running iOS Simulator on a Mac.
3. **Flows to Test:** Proceed through the onboarding screens, create an account, open a Surah in the Reader View, toggle the audio player, and test adding a note or bookmark.

13. Known limitations

Status: Yes **Details:**

- **Offline Mode:** While caching is implemented, heavy first-time usage (like downloading audio for a full Surah) requires a stable internet connection. Full offline-first capabilities are slated for a future update.
- **Push Notifications:** iOS push notifications require physical device testing via TestFlight and will not work in the provided Simulator build.

14. Product Thinking Answer

Status: Yes **Details:** The core philosophy behind this app was to remove friction from the daily habit of Quran memorization and reading. Rather than overwhelming the user with complex settings, the app defaults to a clean, premium reading experience with easily accessible bottom sheets for tools (like Tafsir, Notes, and Audio). By integrating progress tracking (Hifz) directly into the reading flow, we create a positive feedback loop that encourages consistency. The recent UI overhaul specifically targets cognitive load, making the app feel calm, focused, and intuitive.
